INDUSTRIAL VACUUM PRESSURE SYSTEMS

SPECIAL INDUSTRIAL CONSTRUCTIONS

FOR OVER 50 YEARS SPECIALISTS IN VACUUM-PRESSURE TECHNIQUE

Naaktgeboren Rotterdam B.V. has been an active innovator in the field of vacuum-pressure technique for over 50 years. The first vacuum-pressure truck left the factory as early as 1949. Eleven years later – in 1960 – Naaktgeboren Rotterdam B.V. introduced the first blowing unit for the pneumatic transport of dry products. This machine became the basis of the Vacu-Press® today.

THE CONCEPT OF VACU-PRESS®

Vacu-Press® pumps are characterised by their ability to move large quantities of air at a high of low vacuum and their high continuous overpressure induced by blowing. The ingenious cooling air system means the units can produce a high vacuum and be highly efficient. Thanks to an advanced lubrication system and the strenght of the pump, both low and high linear speeds are available – which is why Vacu-Press® machines are capable of supplying relatively low quantities of air at high pressure.

Simplicity of the well-considered concept guarantees a machine of exceptionally high reliability. The cylindrical tanks and filter compartments are suited for full vacuum up to the maximum pressure.

The comfort and safety of the operator have always been important starting-points – as have low maintenance and user friendliness; for example – the rear door has hydraulic, self-adjusting, maintenance-

free wedge locks, the filter compartment can be completely emptied via the large oval hatch, the rear and the filter compartment door can be opened over the diameter of the tank and the filter elements are easily removable.

The **good** reputation of the Vacu-Press® is based on its reliability, long lifespan and high residual value. All this is the result of using only the best materials when constructing the machine: tank, filter compartment and all product contact parts are made of stainless steel.

Reducing noise pollution and protecting the environment were important considerations when designing the Vacu-Press®. The double filter system has such a high degree of separation that the emission value is extremely low and pollution of the pump is limited.

COMPLETE RANGE OF PRODUCTS

Naaktgeboren Rotterdam B.V. is always ready to respond quickly to new developments, and this has led to the development of a complete range of high-quality products. Many of these are exactly the right solution for specific pneumatic transport problems, where vacuum engineering, bulk transport or related areas are concerned. The installation can be fitted in a container or on a truck chassis or trailer/semi-trailer.

CONSTANT INNOVATION

Naaktgeboren Rotterdam B.V. deals with product development on a large scale, based on its extensive experience and knowledge. This enables the company to be at the forefront when it comes to making the transportation of material by suction and blowing faster, safer and more convenient.

Knowledge and expertise

Knowledge and expertise make Naaktgeboren Rotterdam B.V. a reliable partner from A to Z. Naaktgeboren Rotterdam B.V. is at home everywhere.

The **ADR** complies with all relevant regulations and codes of practise and is the solution for the transport of toxic and hazardous products.
